

PENETRATION TESTING

Bulletproof your critical data with advanced testing from cyber security experts

By using all the tools and tricks available to real-world attackers, Bulletproof penetration tests uncover weak points in your applications, infrastructure and network, and let you know how to put them right.

Stay ahead of the hackers

Bulletproof penetration tests uncover weaknesses in your infrastructure, helping you proactively prevent real-world attacks. They're also a core component of a good risk-management strategy, improving your overall security posture and keeping you in total control.

Our in-house security analysts have years of experience in the most security-conscious industries, including financial services and Government. We have even performed red team assessments for some of the largest data centres in the world.

Bulletproof staff are our key asset, so we make sure all our penetration testing services are carried out by experts in their respective fields, certified by independent industry bodies such as CREST and Tigerscheme.

“Bulletproof filled me with confidence at every stage of the process. Afterwards we received a thorough, comprehensive report that was easy to understand.”

Karandeep Chana, IT Manager, Paymentsense

Your best defence against cyber threats

What to expect from a penetration test?

Before any test begins we present you with a clear, defined scope and methodology to make sure you're comfortable with every stage of the process. We'll then use cutting-edge tools and our security expertise to analyse the target systems for weaknesses, before exploiting them using the latest techniques. Afterwards, you'll receive a comprehensive and easy-to-understand report that details everything we found and, crucially, how you can put it right.

Types of test

Infrastructure and Network Testing

Application Testing

Configuration/Build Review Testing

Social Engineering Testing

Red Team Assessments

Bulletproof your critical data

At Bulletproof, security's in our DNA. We're dedicated cyber security specialists, combining recognised, industry-standard qualifications with the latest technology and years of experience. Our penetration tests can be integrated into an end-to-end security solution, including managed SIEM, IDS/IPS, DDoS mitigation, and more.
